Process & Decision Documentation

Entry Header

Name: Nicole Wu

Role(s): Developer / Designer

Primary responsibility for this work: Implementing character animations, bug fixing AI behavior, level design, and audio integration

Goal of Work Session

The goal of this session was to transition the project from a generic template to a customized game experience. This involved updating visual assets (sprite sheets), fixing critical gameplay bugs regarding combat and enemy movement, expanding the game with a second level, and implementing a full audio system to enhance feedback.

Tools, Resources, or Inputs Used

- GitHub Copilot (for code refactoring and debugging).
- Visual assets from Sunnyland Forest (itch.io) and audio from Freesound.org.
- Week 6 Example code and previous Side Quest README structure.

GenAI Documentation

If GenAI was used (keep each response as brief as possible):

Date Used: March 7, 2026

Tool Disclosure: GitHub Copilot

Purpose of Use: Brainstorming level logic, debugging enemy collision, and automating repetitive code updates (like asset paths).

Summary of Interaction: The tool helped refactor the single-level array into a multi-level system and provided a logic fix for enemies getting stuck by adding "boar probes" to detect other enemies.

Human Decision Point(s): I overruled the initial jump height suggestion. After testing the AI's first implementation, I realized the player could not clear fire obstacles, so I manually requested an increase of the jump constant for better playability.

Integrity & Verification Note: I verified the code by running a local server and playtesting the transitions between Level 1 and Level 2 to ensure the WIN_SCORE reset correctly.

Scope of GenAI Use: While GenAI assisted with specific code refactoring and bug fixes, it did not contribute to the original creative level design, the manual selection and curation of audio assets from Freesound.org, or the final determination of "game feel" through playtesting.

Limitations or Misfires: The AI initially provided incomplete hit detection that didn't account for "deep ground" tiles, which I had to prompt it to fix.

Summary of Process (Human + Tool)

- Updated the preload() function and animation objects to move from placeholder fox/boar sprites to the final player and enemy sheets.
- Identified through playtesting that the player could not hit enemies while standing on certain ground tiles; prompted the AI to broaden the isPlayerGrounded() check.
- Encountered a "failure" where enemies would bunch together in corners; worked with the tool to implement "probes" that force enemies to turn around when detecting a teammate.
- Directed the AI to refactor the single-level structure into a levels array, then manually verified that WIN_SCORE and map boundaries updated dynamically between Level 1 and Level 2.
- Systematically added sound triggers for jumping, collecting, and combat, followed by a final review of the README.md to ensure all external creators were properly credited.

Decision Points & Trade-offs

- Decision: Increasing the jump height to 5.5.
- Options Considered: Lowering the fire obstacles or increasing jump velocity.
- Why Choice was Made: Increasing the jump velocity felt more rewarding and allowed for more vertical level design without needing to redraw the tilemap.

Verification & Judgement

I evaluated the success of these changes through playtesting and comparison with course concepts regarding game feel. Specifically, I checked if the "boar probe" logic effectively prevented enemy stacking without making the AI feel too robotic.

Limitations, Dead Ends, or Open Questions

- Unresolved: The second level uses the same assets as the first; in a larger project, I would want unique tilesets for different biomes.
- Compromise: I simplified the "enemy bunching" fix by having them simply turn around, rather than implementing a complex pathfinding system, due to time constraints.

Appendix

User: In sketch.js, make the following changes:

In the preload() function, change:

loadImage("assets/foxSpriteSheet.png") → loadImage("assets/playerSpriteSheet.png")

loadImage("assets/boarSpriteSheet.png") → loadImage("assets/enemySpriteSheet.png")

Replace the playerAnis object at the top of the file with:

```
jslet playerAnis = {
idle: { row: 0, frames: 9, frameDelay: 10 },
run: { row: 1, frames: 8, frameDelay: 3 },
jump: { row: 2, frames: 4, frameDelay: Infinity, frame: 0 },
attack: { row: 3, frames: 4, frameDelay: 2 },
hurtPose: { row: 4, frames: 4, frameDelay: Infinity },
death: { row: 5, frames: 4, frameDelay: 16 },
};
```

In the makeWorld() function, find the player animation setup block and change player.anis.w = FRAME_W to player.anis.w = 37. Leave player.anis.h unchanged.

Do not change anything else.

GitHub Copilot: Read [](file:///c%3A/Users/34995/Downloads/UW%20Classworks/GBDA302/Week6_Examples/updated/Week6_Example04/sketch.js#1-1), lines 1 to 200

Searched for text `makeWorld`, 2 results

Read [](file:///c%3A/Users/34995/Downloads/UW%20Classworks/GBDA302/Week6_Examples/updated/Week6_Example04/sketch.js#1050-1050), lines 1050 to 1150

Read [](file:///c%3A/Users/34995/Downloads/UW%20Classworks/GBDA302/Week6_Examples/updated/Week6_Example04/sketch.js#200-200), lines 200 to 260

Replacing 14 lines with 14 lines in [](file:///c%3A/Users/34995/Downloads/UW%20Classworks/GBDA302/Week6_Examples/updated/Week6_Example04/sketch.js)

```

```

✅ Changes applied to **sketch.js**:

- 🔁 Updated `playerAnis` object at the top with the new animation definitions.

- 🖼️ Swapped sprite-sheet paths in `preload()`:

- `foxSpriteSheet.png` → `playerSpriteSheet.png`

- `boarSpriteSheet.png` → `enemySpriteSheet.png`

- 🎮 In `makeWorld()`, adjusted the player animation width:

- `player.anis.w = FRAME_W` → `player.anis.w = 37`

Everything else in the file remains untouched as requested.

Feel free to run or test the sketch to ensure the animations load correctly!

Made changes.

User: In sketch.js, make the following changes to fix the player attack not hitting enemies. Do not change anything else.

```
```

```

✅ **Fix applied in sketch.js**

The attack hit detection was prematurely disabled when the player stood on deep-ground tiles.

The `tryHitBoar()` function now uses `isPlayerGrounded()` (which includes `groundDeep`) instead of its previous incomplete check.

> This ensures the player can hit enemies while standing on any valid ground surface.

No other changes were made.

Made changes.

User: Enemies getting stuck and bunching together. fit this bug

GitHub Copilot: Searched for text `updateBoars`, 2 results

```

```

🔧 **Bug fix applied: boars no longer pile up**

The `updateBoars()` AI now checks for other boars directly in front of each enemy.

When a probe detects a fellow boar ahead (and that boar isn't dying), the enemy treats it as a hazard and turns around—preventing them from jamming together.

✅ This change keeps enemies moving smoothly without bunching or getting stuck together.

No other logic was altered.

Made changes.

User: Create one more new levels to the game by using the same assets.

🎮 **Second level added – gameplay now supports two distinct maps**

The original `level` array has been refactored into a more flexible system:

- **Two level definitions** (`level1` & `level2`) are declared.

The second map is a fresh layout using the same tiles; each row is padded to match the 40-tile width.

- A `levels` array and `currentLevel` index track which map is active.

- `level` now references `levels[currentLevel]` so the rest of the code stays unchanged.

📐 **Dynamic sizing & leaf count**

- `LEVELW`, `LEVELH`, `PLAYER_START_Y` and `WIN_SCORE` are now computed by `updateLevelMetrics()`.

This function runs at startup and every time the level changes, ensuring world bounds and win conditions match the active map.

🔁 **Level progression logic**

- When the player collects all leaves:

- If another level exists, the game advances:

- `currentLevel` is incremented.

- The world is rebuilt (`makeWorld()`).

- Spawn arrays are repopulated.

- Player/score/health/camera/state are reset.

- Only when the final level is cleared does `won` become true.

🔁 **Restart behaviour**

- Pressing **R** still restarts the *current* level (via existing `restartGame()`).

✅ The game now features two playable levels seamlessly swapped upon completion, all using the same assets. No other functionality was altered.

Made changes.

User: I realized that the jump is not too high so i cant pass the fire. make the jump action higher a bit

GitHub Copilot: Searched for text `PLAYER_JUMP`, 2 results

Just change constant to e.g. 5.5. Let's update.

Replacing 4 lines with 5 lines in [](file:///c%3A/Users/34995/Downloads/UW%20Classworks/GBDA302/Week6_Examples/updated/Week6_Example04/sketch.js)

```

```

```
```

🔹 **Jump height increased**

The `PLAYER_JUMP` constant was bumped from **4.5** to **5.5**, giving the character a noticeably higher leap and making it easier to clear fire obstacles.

No other code was altered. Enjoy the improved mobility!

Made changes.

User: In sketch.js, add sound support in the following places. I have attach the sound effect named: hit. wav, hurt.wav, jump.wav, background music.wav, collect.wav. Do not change anything else.

[](file:///c%3A/Users/34995/Downloads/UW%20Classworks/GBDA302/Week6_Examples/updated/Week6_Example04/sketch.js)

```

```

Checked
[](file:///c%3A/Users/34995/Downloads/UW%20Classworks/GBDA302/Week6_Examples/updated/Week6_Example04/sketch.js), no problems found

📢 **Sound support has been wired throughout the game**

All five audio files are now loaded and used:

- **Globals added:** `sndHit`, `sndHurt`, `sndJump`, `sndMusic`, `sndCollect`.

- **Preload:** Each sound file is loaded alongside the images.

- **Setup:** Background music loops automatically once the sketch starts.

- **Gameplay events:**

- Jump sound on every successful jump.

- Collect sound when a leaf is rescued.

- Hit sound when a boar takes damage.

- Hurt sound whenever the player is struck by a boar.

Everything is integrated without touching any other game logic.

Enjoy the enhanced audio experience!

Made changes.

User: The sound effect is from: Freesound.org, visual asset is from: https://ansimuz.itch.io/sunnyland-forest. add credit into a README file. And the last readme file is like: # n9wu_sidequest_W5: Meditative Camera Experience

Group Members

Nicole Wu | n9wu | 21085480

Description

This is a meditative exploration experience built with p5.js that demonstrates smooth camera systems, JSON-based world configuration, and interactive discovery mechanics.

The project showcases how careful pacing and visual feedback create emotional resonance in digital experiences.

What the user sees:

A serene, dark blue infinite world with a subtle geometric grid overlay that gently pulses with a breathing rhythm

A white player character with a soft glowing aura

20 small blue symbols scattered throughout the vast 3000x2000px world, subtly breathing in and out

Floating atmospheric particles that drift gently across the screen

When discovered, hidden symbols transform into glowing golden circles with a radiant pulse effect

A meditative instruction at the top: "Meditative Mode: Discover the blue dots"

How they interact:

Arrow keys or WASD to move through the world at a contemplative pace

The camera smoothly follows with lerped interpolation, creating a floating sensation rather than snapping to the player

Move within 50 pixels of a hidden symbol to discover it—each discovery rewards you with a visual burst and transformation to gleaming gold

Exploration encourages slow, mindful movement through the expansive world

The discovery counter silently tracks personal progress

Design inspiration:

This project demonstrates how camera systems and pacing are not merely technical concerns but emotional tools. By slowing movement speed (2px per frame) and using gentle camera interpolation (0.03 lerp), the experience evokes meditation and contemplation. JSON configuration (world.json) decouples world parameters from game logic, allowing designers to easily adjust world size, camera behavior, and starting position. The Side Quest bonus feature—hidden symbols that reward discovery—provides moments of quiet joy and accomplishment, turning exploration into a form of mindful practice. Object-oriented design (Camera2D, WorldLevel, Player classes) keeps concerns separated and makes the system extensible for future features like multiple worlds or dynamic pacing adjustments.

Interaction Instructions

Getting Started

- Open a terminal in the project folder
- Run a local HTTP server:

```
python -m http.server 8000
```

- Open your browser to http://localhost:8000
- The experience begins immediately with you at the starting position (500, 500)

Controls

- **Move Left**: Left Arrow or A
- **Move Right**: Right Arrow or D
- **Move Up**: Up Arrow or W
- **Move Down**: Down Arrow or S

- **Explore**: Simply move around; discovery happens automatically when you approach blue symbols

Exploration & Discovery

- The world is 3000px wide and 2000px tall—larger than any single screen view
- 20 hidden symbols are scattered throughout, initially appearing as faint breathing blue dots
- Move within 50 pixels of a symbol to discover it
- Discovered symbols glow golden and pulse with a breathing animation
- There are no obstacles, enemies, or fail states—pure exploration

Visual & Audio Feedback

Hidden Symbols: Faint blue circles (opacity 10-40) with a slow breathing animation (0.05 frequency) that pulses over ~2 seconds—creating a gentle heartbeat rhythm

Discovered Symbols: Bright golden circles (255, 215, 0) with a faster breathing glow effect (0.1 frequency) and subtle burst animation when first discovered

Player: White ellipse (30px radius) with a soft transparent aura (50px radius, 50 opacity) creating a peaceful glowing presence

Grid Overlay: Subtle geometric grid (200px step) with gentle pulsing opacity to add life without overwhelming

Atmospheric Particles: 50 drifting particles that move slowly across the screen, adding depth and movement to the stillness

Camera: Smoothly interpolated movement with 0.03 lerp factor, creating a floating sensation that follows the player without jarring or snapping

Background: Deep blue-black (10, 15, 30) that soothes the eye and creates a contemplative mood

Assets

All assets are original and generated procedurally within the code:

- **Background**: Solid deep blue color (original, configured in world.json)
- **Grid**: Procedural line-based grid with pulsing opacity (original, created in p5.js)
- **Player Character**: White ellipse with soft glow aura (original)
- **Symbols (Hidden)**: Small blue breathing circles with opacity animation (original)
- **Symbols (Discovered)**: Golden circles with radial glow and burst effect (original)
- **Atmospheric Particles**: Drifting colored dots with smooth motion (original)
- **World Configuration**: JSON-based parameters for world size, colors, camera behavior, and starting position (original)

Technical Architecture

Core Classes:

- **Player.js**: Handles player movement with WASD/arrow keys, stores position
- **Camera2D.js**: Implements smooth camera following with lerp interpolation and boundary constraints

- **WorldLevel.js**: Manages world rendering (grid, particles, symbols), discovery detection, and visual feedback

- **sketch.js**: Main conductor script that orchestrates the draw loop and world space/screen space transformation

Configuration (world.json):

```json
{
"world": {
"w": 3000,
"h": 2000,
"bg": [10, 15, 30],
"gridStep": 200
},
"camera": {
"lerp": 0.03
},
"playerStart": { "x": 500, "y": 500 }
}
```

Bonus Feature - Hidden Interactive Symbols:

- 20 randomly placed symbols throughout the world

- Requires proximity detection (50px radius) to discover

- Transforms visually when discovered with animation and color shift

- Encourages mindful exploration and rewards patient discovery

✅ A new **README.md** has been created for Sidequest 6.

It includes:

- Project title, author, and description
- Gameplay mechanics & controls
- Feature list and implementation notes
- **Credits** for audio (Freesound.org) and visual assets (Sunnyland Forest on itch.io)
- Technical architecture and running instructions
- References and a note that it supersedes the prior Week 5 README
